MORE ABOUT OUR GASKET SELECTION

Here at B.A. Fischer Sales, we do our best to identify gaskets over the phone. The diagram to the right should help you describe to us what kind of gasket you have. When time permits, you can always UPS or mail us a gasket and we can identify it and send you

TYPICAL CHEVRON TYPE GASKET

AMES GASKET AND SPRING SIZING

WHEELINE O-RING, AND QUAD RING

for couplers - see Wheeline

PIVOT GASKETS - MOLDED AND FLANGE

See Pivot Section

BUNA O-RINGS

Commonly used and petroleum resistant, we stock the largest inventory of O-rings in Boise. SAE and Metric.

FLAT GASKETS

We can also cut custom flat gaskets or provide a wide array of commonly used gasket materials. Diesel fuel tanks, flanges, pumps, snow plow or mud flaps are some examples.

RUBBERS AND ELASTOMERS COMMONLY USED IN GASKETS

SBR - Styrene - Butadiene
 Good flex cracking resistance
 Excellent abrasion resistance
 Poor ozone resistance
 Fair weathering resistance

EPDM - Ethylene Propylene
 Very good flex cracking resistance
 Good-Excellent abrasion resistance
 Outstanding ozone resistance
 Outstanding weathering resistance

CR - Neoprene - Poly-Chloroprene
 Very good flex cracking resistance
 Excellent abrasion resistance
 Very good ozone resistance
 Very good weathering resistance

Poly - Polyethylene
 Has poor working properties
 Not popular for irrigation gaskets

Plasticizer - an oil based additive
 used in the manufacture of neoprene. Used to help in the bonding of materials and faster cooling. Gives the material a slick shiny look. Can reduce the life of the material when it dries out.

Most OEM's use a SBR-EPDM blend whenever possible. We furnish or buy our gaskets from molders who use this blend, for gaskets that last longer.

INSTRUCTIONS FOR ADJUSTING AMES ABC SPRINGS - A.K.A. BALL AND SOCKET

All Ames ABC Springs are accurately sized before shipment from the factory. No adjustment should be necessary on new springs. After prolonged use in the field, springs will occasionally require a simple adjustment to keep them in good working order. With the following procedures you should be able to keep your Ames ABC sprinkler lines in good working order.

Symptom - Pipe or fittings blow apart under working pressures.

Remedy - The spring is too loose (too large in diameter) when the above occurs. You must compress the spring in order to bring it back to it's proper size. Using a pair of needle nosed pliers pinch the spring coils together at six or eight points around the circumference (see Fig. 1). The spring should now be smaller in diameter. To test for proper size, gently push spring over ball end of pipe (see Fig. 2). Only slight pressure should be required to push the spring back and forth over the ball. **If the spring tends to roll when pushed over ball they are too tight.**

Symptom - Pipe is difficult to uncouple.

Remedy - The spring is too tight (too small in diameter) when the above occurs. In order to stretch most springs merely take the spring in both hands and gently pull open the coils (see Fig. 3). Care should be taken not to stretch the spring too far. Considerably greater force is required to stretch larger diameter springs. When stretching a large spring place spring over a stationary object, preferably round, so that both hands may be used. Stretching at several points around the circumference is necessary for even distribution.

Test for proper size, gently push spring over ball end of pipe (see Fig. 2). Only slight pressure should be required to push the spring back and forth over the ball. **If the spring tends to roll when pushed over ball they are too tight.**
