

IFA Platinum Show Power Feeds are formulated with the latest technology to increase the efficiency of the nutrients fed to your show animals. Formulated as a tool kit, and customized for each species of your animals, to achieve its genetic potential. IFA Platinum Show Power is formulated by IFA Nutrition Experts with added power provided by Biozyme's Sure Champ technology.

UNLEASH YOUR ANIMAL'S FULL POTENTIAL

IFA Platinum Show Power Steer feeds are formulated with all natural plant proteins for optimal nutrient accessibility. The texturized formula with molasses enhances the flavor and encourages dry matter intake by stimulating appetite. Formulated with Bovatec for the prevention of coccidiosis and increased feed efficiency.

Extra B-Vitamins to Meet Increased Needs During Stress

Decreases Body Temperature in Heat-stress Animals

Complete Daily Vitamin and Mineral Supplement

Coccidiosis Control and Increased Feed Efficiency

Feed 15% formula up to about 1000 lbs, then switch to the 13% feed.

Depending on the feeding situation and the growth rate of the steer, this can be modified to provide more accurate growth. If your steer is larger framed and/or gains weight easily, the 13% feed is a good option to provide slower growth. If your steer is lighter and doesn't put on weight as well, the 15% feed would be a better choice.

IFA's Platinum Show Power Feeds are formulated using Amaferm®, a precision-based prebiotic designed to enhance digestibility by amplifying nutrient supply for maximum performance.

- Promotes feed and water **INTAKE**
- Increases feed **DIGESTIBILITY**
- Maximizes nutrient **ABSORPTION**

INCREASED INTAKE

Intake is controlled by many factors including physical fill and energy requirements. With increased digestion, it allows the animals to consume more feed in a day.

INCREASED DIGESTIBILITY

Digestibility determines the amount of feed that is used by the animal for growth, reproduction, etc. Essential nutrients in the form of energy, protein, minerals, vitamins and water must be provided and digested if the animal is expected to maximize performance.

MAXIMIZED ABSORPTION

Absorption is the movement of molecules across the gastrointestinal (GI) tract into the circulatory system. Most of the end-products of digestion, along with vitamins, minerals, and water are absorbed in the small intestinal lumen using four mechanisms: 1) active transport, 2) passive diffusion, 3) endocytosis, and 4) facilitative diffusion.

HOW DOES IT HAPPEN?

WHERE THE MAGIC TAKES PLACE...

WHAT DOES IT GIVE YOUR ANIMALS?

The care you provide your animals is more important than the feed. **Please make sure feed and water are always available. Periodically weigh feed to ensure proper amounts are being fed.** To maintain desired condition, you may need to increase or decrease feeding rates.
